Envelock — Google OAuth Verification

Demo video script & recording checklist · Scopes: `gmail.modify` + `gmail.settings.basic`

Before you record — checklist

- [ ] Use a **test Workspace account** added as a test user — in a **test project** if the app hit the user cap. Do **not** use production traffic.
- [ ] Screen-record at **1080p**, browser only — no personal tabs, bookmarks, or notifications visible.
- [ ] Prepare a test inbox with: (a) one fake **"supplier bank-details change / invoice"** email, (b) one message **containing a link**, (c) a **forwarding rule or filter** set on the mailbox so rule-monitoring has something to show.
- [ ] Have the **OAuth Client ID** visible in Google Cloud Console, ready to show on screen.
- [ ] Confirm the **Limited Use statement** is live on `envelock.org/legal` (needed for Scene 6).
- [ ] Narrate in **English** (or burn in captions). Upload **unlisted** to YouTube.

Script ~3–4 min

0:00–0:20 · Scene 1 — Identify the app

On screen: Google Cloud Console → your OAuth client with the **Client ID visible**. Then the Envelock sign-in page at `app.envelock.org`.

> 🎙 *"This is Envelock, an email-security service for businesses. This video shows how our app uses the Gmail scopes we've requested. The OAuth client ID for this app is shown on screen. Envelock is published by Envelock, and our home page is envelock dot org."*

0:20–0:55 · Scene 2 — Consent flow & scopes

On screen: In Envelock, click **Connect Google**. Let the real Google consent screen load. **Slowly scroll** so both scopes are clearly visible. Show the **"Google hasn't verified this app"** screen and click through (Advanced → Go to Envelock).

> 🎙 *"When a business connects their mailbox, Google shows them exactly what Envelock will access. We request two scopes: gmail.modify, and gmail.settings.basic. Because the app isn't verified yet, the test account sees the unverified-app screen — expected during this review. The user grants consent explicitly."*

0:55–1:40 · Scene 3 — gmail.modify (read & alert)

On screen: The test inbox has the fake "supplier changed bank details" email. Switch to the Envelock dashboard; show the **CRITICAL alert** it raised, naming the subject and sender.

> 🎙 *"Envelock reads incoming messages to detect fraud. Here it flagged a payment-fraud attempt — a supplier appearing to change their bank details — and raised a critical alert for the account owner. This is the core of what gmail.modify's read access is used for."*

1:40–2:30 · Scene 4 — gmail.modify (act on the message)

On screen: Back in Gmail, show the flagged message now has an **Envelock warning label / moved to a quarantine label**. Open a message with a link and show the **rewritten link + warning banner** Envelock added.

> 🎙️ *"Protecting the user means acting on the message, not just reading it. Envelock applies a warning label and moves confirmed-malicious mail to a quarantine label. For risky links, it rewrites them so they're re-checked the moment they're clicked, and adds a visible warning in the message. This is why read-only access isn't enough — and why we need gmail.modify. Envelock never sends email on the user's behalf and never permanently deletes mail."*

2:30–3:15 · Scene 5 — gmail.settings.basic

On screen: In Envelock, open the mailbox's rule / forwarding view. Show it **reading the existing filters and forwarding addresses**, and an **alert when an unexpected forwarding rule appears**.

> 🎙️ *"gmail.settings.basic lets Envelock read the mailbox's filters and forwarding configuration. When an attacker takes over a mailbox, they often add hidden auto-forwarding rules to steal mail. Envelock reads these settings and alerts the owner when a new or unexpected rule appears. Envelock only reads this configuration — it never creates, changes, or deletes any Gmail setting."*

3:15–3:40 · Scene 6 — Data handling & close

On screen: Briefly show your privacy policy page (`envelock.org/legal`) with the Limited Use statement visible.

> 🎙️ *"Gmail data is used only to generate security alerts for the account owner. It's never sold, never used for advertising, and never used to train generalized AI models — consistent with Google's Limited Use requirements, as stated in our privacy policy. Thank you for reviewing Envelock."*

Reviewer-pass tips

- **Show, don't just say** every scope — the reviewer must *see* the read, the label/quarantine, the link rewrite, and the forwarding-rule read actually happen. This is the #1 reason videos get bounced.
- Keep the **Client ID visible** at least once (Scene 1).
- If the project has more than one OAuth client, the video must show **all** of them.
- Don't rush the consent screen — give 3–4 seconds on the scope list.

Dependency: Scene 6 needs the **Limited Use statement** actually present on the Legal page. It's required for both this video and the written verification.
